

DAILY PLANNER

Dinh Ngoc Bui

A daily planner electron application is a software tool designed to help users organize and manage their daily tasks, appointments, and activities in a digital format.

The term "electron" refers to the technology used to build cross-platform desktop applications using web technologies like HTML, CSS, and JavaScript.

This allows the application to run on multiple operating systems (Windows, macOS, Linux) without significant modifications.

User Interface: The application provides a user-friendly interface that resembles a traditional paper planner or calendar. It may include a calendar view, where users can see their tasks and events for the day, week, or month. Additionally, it may have a task list or to-do list view to manage individual tasks.

Time Management: Users may have the option to allocate specific time slots for tasks, helping them plan their day more effectively. Some applications even allow users to block time for specific activities, making it easier to follow a routine.

Task Management: Users can add, edit, and delete tasks or events. Each task can have various attributes like title, description, due date, priority, and category. Users can mark tasks as completed and also set reminders for important tasks.

Offline Access: An electron application typically allows users to use the daily planner offline without an active internet connection. Any data entered or changes made while offline will be synchronized when the device is back online.

Future Versions:

- **Data Synchronization**
- **Customization**
- **Data Backup and Restore**
- **Reminders and Notifications**
- **Calendar Integration**
